Finishing the Match: A Skill Which Requires Specific Coaching for Female Tennis Players

Federico Di Carlo
Atri, 64030 (Te), Italy

Abstract: Tennis psychology has often considered a tennis match divided into three mental phases: beginning, development and finish. The last stage of a match, the finishing one, has always been acknowledged as paramount and a crucial factor to a player’s success. The competitive situation of finishing a match can be extremely stressful. Female players have a natural and biologic tendency to live and face this situation differently from male players. The mental association of “finishing” a match and “finishing” an opponent provokes turmoil in the female mindset since she hesitates between her professional due and her natural instinct to preserve life. Male biological, sociological and psychological development adapted him to the symbolic act of eliminating his opponent. The ability to finish off a match is pivotal for a player success and female players should master that ability since it is a paramount competitive advantage. Behaviours can be learnt and modified, so even the finish off a match can be trained and improved.

Key words: Performance, killer instinct, competitive advantage, neuro-science, coaching.

1. Introduction

Tennis psychology has often considered a tennis match divided into three mental phases: beginning, development and finish. The last stage of a match, the finishing one, has always been acknowledged as paramount and a crucial factor to a player success. The mental ability to finish off a match is very often referred to as “killer instinct”. Several researchers studied the issue from several points of view: concentration [1-3], determination [4], suggestions on how to practice it [5] on court but they never investigated the sociologic, biologic and neuro scientific aspect of the issue.

The word “killer instinct” itself suggests the image of a tennis match as a struggle for survival [6]. Even if we considered the points of a match equally important, at the end of the match, one of the two players will lose and be eliminated from the tournament. So both tennis players are in the position to “finish” the opponent, survive in the contest and stay alive in the tournament.

The act of “terminating” the opponent has a deep and important impact on the player mental state and above all on the female players.

2. Material and Methods

Biological, sociological and neuro scientific find outs suggest that the symbolic act of “eliminating an opponent” is harder for a female player than a male one. Human brain and psychology developed in history according to the role that both genders had in the evolution of the species. Human brain was not made and did not develop to play tennis.

2.1 The Biologic Aspect

Human female place in the biologic chain is to give birth to babies and protect her beloved from dangers and predators. She can be ferocious and ready to die for defending her babies, to preserve life. The flip of the coin is that she becomes extremely vulnerable when asked to be the aggressor, to attack and to take life away from other human beings in offensive way. When she is required to take life away, she struggles with her natural instinct to preserve life. This internal fight provokes intense doubts and lots of troubles on a tennis court during the phase of the match finishing off. On
working and social rights, the social development of women was different than male one. Woman place in society had been perceived as the “angel of the hearth”, that is the one in charge to look after the family. That is the sense of the “matriarchal society”. She was not expected to have a career in sport and business. That was male role. Most times, women experience winning through the mis-concept of historical social heritage. In her mind, victory is not what is expected from her role and may be interpreted as a social rejection rather than a social reward.

2.3 The Neuroscientific Aspect

Neuroscience proved that the emotional brain, the old mammalian, the one who responds to the fight or flight mechanism, is bigger in female than in male [7]. Since female needs to care not only about herself but about babies too, her response to potential danger is bigger than in males. Female emotional brain developed accordingly. To my knowledge today, there is no neuroscientific evidence which describes and compares male/female neuro patterns and biochemistry difference on situations where killer instinct is required.

2.4 Gender Differences

Male players’ instinctive behavior in the match finishing off is somehow different. That means that male do not care for other human beings life? Of course male do and male players sometimes have trouble with the finishing of the match, too. Tennis history has plenty of male chocking cases. However, from a biologic and sociologic point of view, male developed differently and have an advantage over female on the issue. The social and functional role of male in biologic chain is that of hunter. Male was the one supposed to provide food for the family which means killing other forms of life for survival. Basically male biological and psychological development is *mors tua, vita mea*, your death is my life. A male player is somehow used to the symbolic act of eliminating his opponent. Somehow,
male players rationalized that terminating the opponent 
stay in the tournament is not nice but it is part of the job 
in order to survive. Male player may not like to 
“eliminate” opponent but does not have any regret and 
the act of doing it provokes less or any internal turmoil. 
A dirty job, but someone must do it. And male was the 
one supposed to do it and he adapted to it in time. The 
perspective of finishing off a match for a male player is 
part of a work ethics and provokes less internal 
emotional fight.

3. Tennis Implications

Though the finishing off issue maybe more frequent 
on the International Tennis Federation tournaments and 
lower level tennis, sometimes it happens even at higher 
levels too.

Of course, the more players are close and have 
strong relationships, the bigger the feeling of guilt for 
“finishing” the opponent. This is maybe one of the 
reasons for lack of comradeship between female 
players at the top of the game, which is more frequent 
than in male. Many female players may complain about 
it, but avoiding strong personal relationships with other 
players may be seen as an essential part of being a 
professional female tennis player. The ability to finish 
off a match is pivotal for a player success and female 
players should master that ability since it is a big 
competitive advantage.

Usually during the early stages of a tennis player 
activity, above all in ITF tournaments, young tennis 
players may find themselves alone in God forgotten 
places around the world and need social and human 
contact. And that is how players make friendship and 
start personal relationships. However, this has a 
worsening effect on the female ability to finish the 
match on the court.

Besides many female players report that colleagues 
who showed friendship on the early stages, let it down 
no sooner they were beaten on the court. This 
shows that at intuitive or at deep level, some players 
know that personal relationships may have important 
impact on performance and they try to take advantage 
from it.

In male tennis, comradeship is more frequent even at 
higher levels and usually does not have any influence 
on players killer instinct. Male players set apart aspects 
of the business and aspects of social life more easily [8, 
9]. For female players, it is tougher.

4. Cognitive Training Program Principles

As in the case of all mental abilities, the ability to 
finish matches can be trained and improved.

In order to enhance a female player killer instinct 
from a mental, cognitive point of view, we recommend 
training the skill off the court keeping the above key 
points in mind.

The devil you know is better the devil you don’t. 
Cognitive training starts with consciousness. Explain 
the biologic factor behind the “killer instinct”. Athletes 
may have difficulty in understanding the reason, for 
example, male and females need different approach 
towards the issue. Make sure they know what they are 
working for. It will speed learning and practicing 
processes up.

Non Satis Scire. To know is not enough. Knowing 
the ability does not mean having the ability to execute 
it. Point out that finishing matches off is a mental skill 
which is paramount to achieving success. Athletes 
should perceive that finishing matches should be a 
training goal. A goal which needs the implementation 
of a training program and deserves the same work and 
commitment reserved to technical and athletic 
practicing.

You bring in sport what you are in life. Clarify that 
working on match finish means working on the 
person too. Any change which is brought to a personal 
level implies initial discomfort. Humans are “being of 

---

1 The 2012 US Open edition scheduled at quarter finals Sara Errani against Roberta Vinci. They are very close friends in everyday life, travel very often together in the same tournaments, used to play doubles together and play in the Federation cup for the same team. Their match was considered by many commentators as one of the less competitive and less agonistic Grand slam quarter final ever.
habits”. Being exposed to unfamiliar and unknown situations (horror vacui) means getting out of personal psychological comfort zone. Refusal is the first natural reaction to change. Improvement usually goes by two steps in front and one backwards. Make them understand that tennis is their job and there is no identification whatsoever between the job results and the person. Tennis is your sport, what you do, and not what you are. Changing requires motivation, plenty of work and resilience. Make sure athletes are ready, willing and assume responsibility about it.

Nothing happens for real if it doesn’t take place in the mind first. Train the player mind with visualization. Check, identify and explore in the player mind worse-case scenarios. What if they beat the opponent? Will they lose friendship? Is it maybe “faked” or “interested” friendship? Create images of on court real situations, rehearse desired self talk, emotional management and outcome. Imagine difficulties and solutions. Enhance visualization with bright images, clear sounds and positive feelings.

A professional sport is not a part time hobby. It is extremely important that female players have always in mind goals, “work ethic” and professional mentality and attitudes. For female athletes, avoiding friendship with other tennis players maybe one of the sacrifices and renounces required to achieve their best potential. It may be difficult understanding the reasons for isolating or being unsociable to fellow tennis players. As a coach, try to enhance the player social activity outside the tennis world and avoid personal relationships with colleagues as much as possible.

5. Conclusions

The ability to finish off a match is pivotal for a player success. As in the case of most skills, the finish off a match can be trained and improved. Male and female experience the finishing of the match from a different perspective which requires special coaching for female athletes. Female players should master the ability of finishing a match off since it is a paramount gender competitive advantage.

Many researchers provided valuable clues on how train and improve the finish off a match on a practical level. However, poor or no attention has been given to the cognitive aspects of the issue.

New approaches in neurosciences with brain scanning technologies open new frontiers and promise new insights on this intriguing subject.
